Examples of hardware implementation on MCUs

Dedicated hardware design implemented for specific needs

Control Loop Implementation

Cordic (Trigo) - Main features

- Cordic can be used for the following functions:
 - Vector rotation (polar to rectangular): Sin, Cos
 - Vector translation (rectangular to polar): Atan2, Modulus
 - Sinh, Cosh, Exp
 - Atan
 - Atanh
 - Square root
 - Ln
- Cordic provides the best compromise between
 - Hardware complexity
 - Range of functions supported \rightarrow Supports large set of math.h functions
 - Speed-up relative to software (e.g. Sin and Cos are 5x faster than SW execution)

In Motor Control (real application) = ~12% gain in control loop execution !

ADC synchronization example

Avoids PWM-related noise during ADC readings

• In 3-phase motor control applications, an ADC trigger on counter overflow allows you to obtain the average current value and avoids noisy ADC conversions

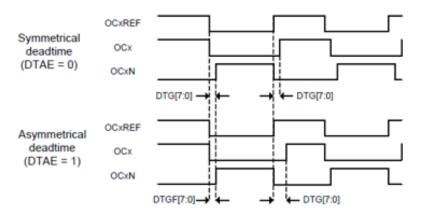

Timers

- Motor Control + Digital potentiometers
 - Better management of incremental encoder sensors
 - 2 new protocols supported
 - Hardware management of the Index (Z) input
- Power conversion
 - Deadtime
 - Asymmetrical: For applications having asymmetrical gate driver / optocouplers propagation delays
 - Shadow register for on-the fly deadtime update (adaptive deadtime schemes)
 - Higher (average) resolution using hardware dithering
- General purpose
 - Higher (average) resolution using hardware dithering
 - New slave mode (gated+reset)

• 4x PWM outputs w/ 4x complementary

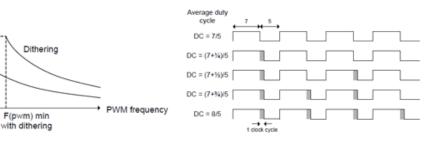

Resolution

Dithering

F(pwm) min

No dithering

16-bit

Dedicated High Resolution Timers

- High resolution PWM
 - 12 channels with 184ps resolution on frequency and duty cycle
 - 184ps is equivalent to 5.4GHz timer clock

- Multiple Event handler
 - 6x Digital and Analog fault input
 - 10x Events cycle to cycle current control or PWM restart (constant Ton/Toff)
 - Blanking, windowing and digital filter

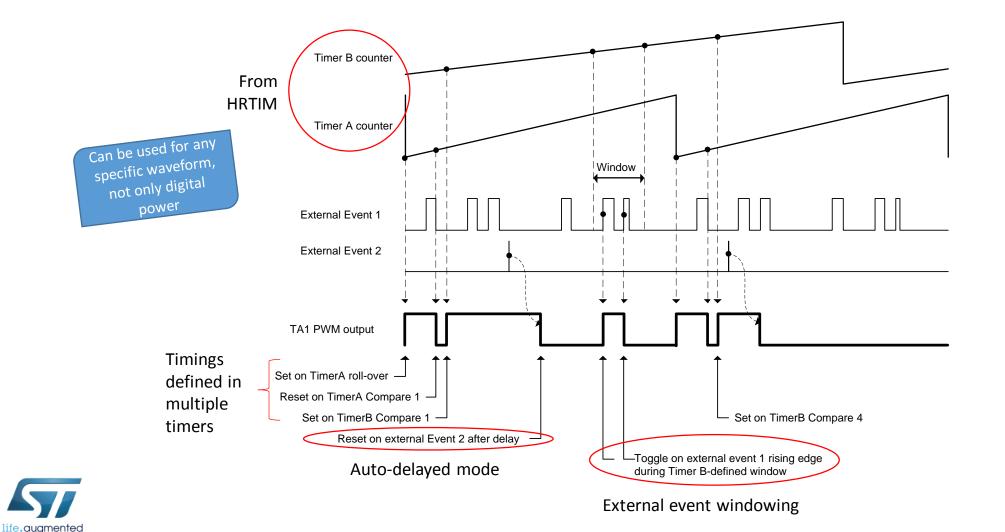

- Flexible PWM generation
 - 7x independent time base to create various shape of PWM
 - Up to 32 set/reset transition per PWM period thx to the built-in crossbar
 - Master/Slave configuration for multi phase converter
- 12 independent channels
 - Any topology supported from 1x 12 PWM (triple interleaved LLC (servers application) up to 12x1 PWM (multiple independent build exceed a modeling kan niet worden converters (lighting)

8 OKT

HRTim - Generating Complex waveforms

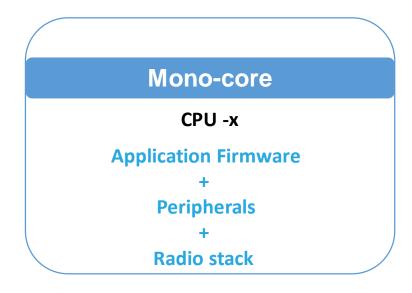

• Up to <u>32 concurrent Set or reset events</u> can be defined per PWM output

Double core for wireless SOC

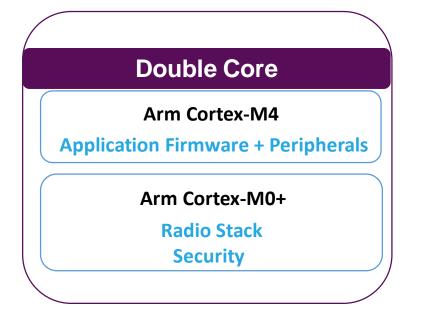

2 independent cores for real-time execution

• Drawbacks

• Time sharing

- Complexity of the firmware
- Real time constraints

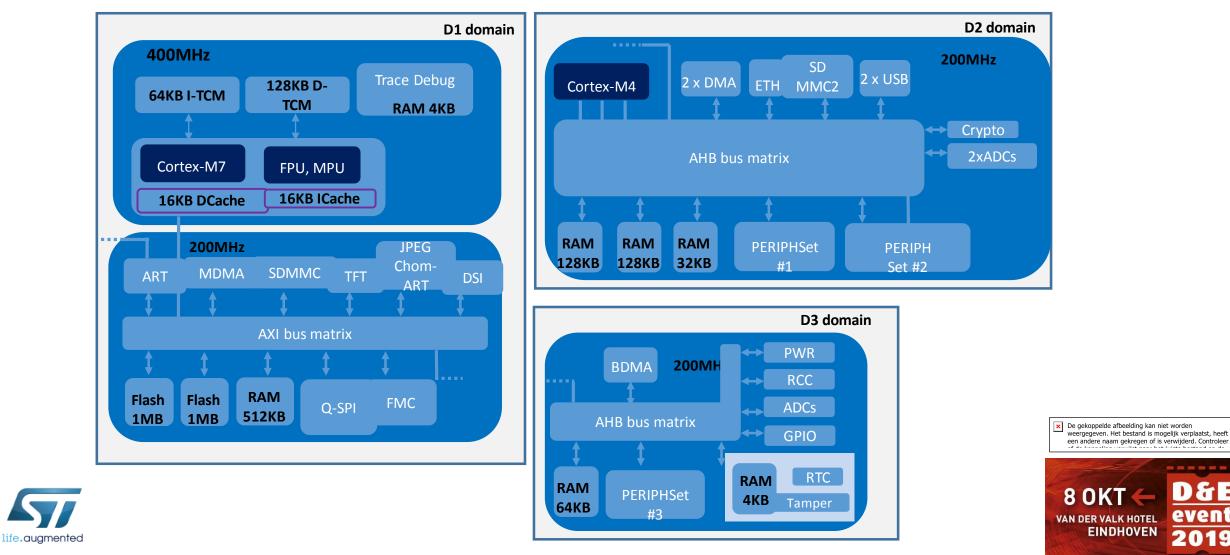

• Benefits

- Full flexibility Easy development User

Low Power modes implementation

FlexPowerControl

- Efficient running
- 8 low-power modes, several sub-modes
- High flexibility

Application benefits

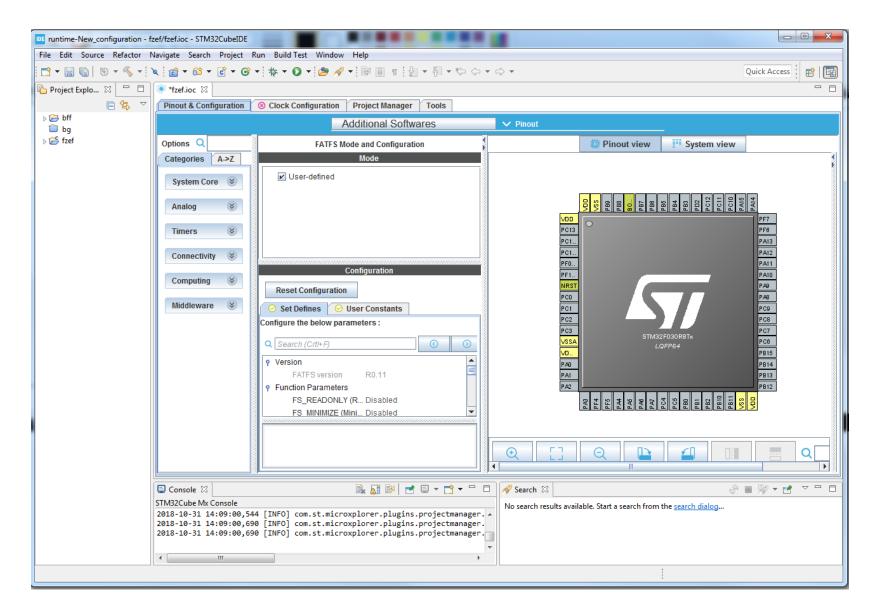

- High performance
 - → CoreMark score 210
- Outstanding power efficiency
 - → ULPBbench score = 175

VAN DER VALK HOTEL EINDHOVEN

STMicroelectronics

- Among the world's largest semiconductor companies
- Serving over 100,000 customers across the globe
- 2018 revenues of \$9.66B, with year-on-year growth of 15.8%
- Listed: NYSE, Euronext Paris and Borsa Italiana, Milan
- Signatory of the United Nations Global Compact (UNGC), Member of the Responsible Business Alliance (RBA)

- ~46,000 employees worldwide
- ~ 7,400 people working in R&D
- 11 manufacturing sites
- Over 80 sales & marketing offices
