The image shows a promotional banner for a D&E event. It features a blue background with a grid of small images showing various electronic components and people working. The text 'D&E EVENT' is in the top left, and 'Het ontwerpen van innovatieve elektronica' is below it. At the bottom, the date 'Woensdag 20 maart 2024' and location '1931 Congressentrum 's-Hertogenbosch' are listed.

Size Matters!

- Battery limitations restrict device placement and functionality
- To increase lifespan, devices are often configured to transmit data less frequently

Environmental Challenge

78 million batteries will be
dumped
every day by 2025!

Energy Harvesting?

First observation: 1826!

Your friends will all admire your **New MILLER**

Here's something NEW to make your cycle—and you!—the centre of attraction. A modern chrome-finished Miller lighting set with a built-in horn! The horn is push-button-operated, runs economically off a dry battery and, together with the powerful dynamo lighting set, makes a brilliant, brand-new combination. Be bright—get this new Miller lighting set. It's as good as it looks—and sounds!

DYNAMO SET WITH COMBINED HEADLAMP & HORN

- SELF-CONTAINED HORN
- LOUD AND CLEAR TONE
- HORN BATTERY OPERATED
- HEADLAMP GIVES BRILLIANT BEAM
- NEW STYLE TAIL LAMP

Set No. 537 T/H
PRICE 50/-
COMBINED HEADLAMP & HORN No. 7/H 27/-

Photovoltaic (PV) Harvesting

- Where there is light, there is Energy!
- Many examples in commercial products today – also being added into beacons, sensors, and tags for IoT applications
- PV is not just about silicon anymore - new technologies like dye-sensitized and organic materials are viable options
- Features like flexible substrates and custom form factors make adding PV to existing applications easier

How much energy can you harvest?

Light Level (lux)	Harvested Energy ($\mu\text{W}/\text{cm}^2$)	Conditions
100	3-10	Dim Indoor
200	7-20	Residential
500	20-45	Office
1000	35-90	Bright Office, Retail, Overcast day
20K	2-4K	Full Daylight
100K	15-20K	Direct Sunlight

Energy harvested varies based on PV cell technology and optimal performance range

Mechanical Harvesting

- Mechanical energy harvesting rely on either piezoelectricity or electromagnetism to create a burst of energy
- IoT Wireless switches use the motion of a magnet through a coil to convert mechanical to electrical energy
- Actual amount of energy harvested is in 100s of μW – enough power for multiple wireless transmissions

Thermal Harvesting

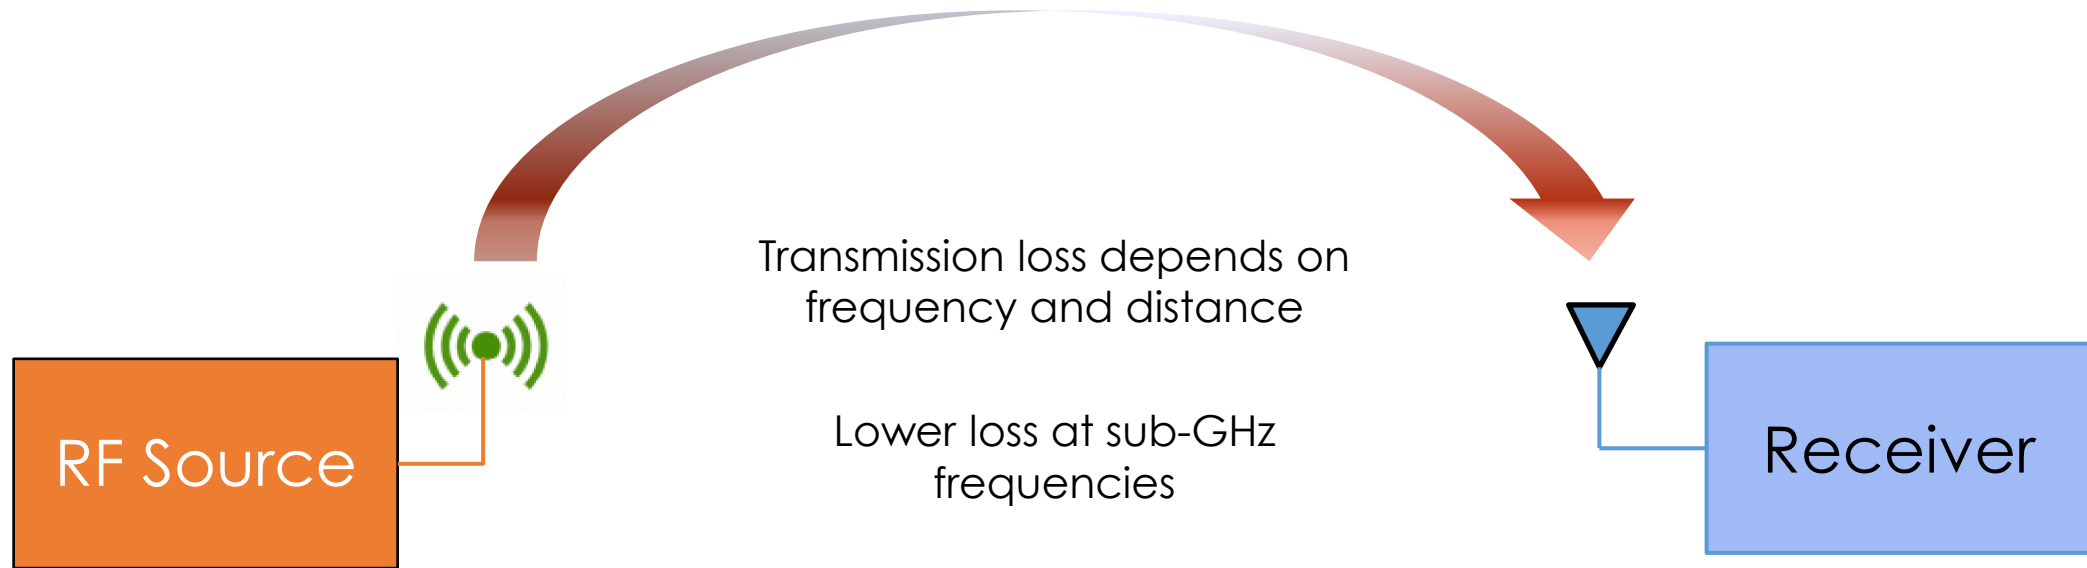

- Thermo-Electric Generator (TEG) requires a temperature gradient to generate electricity
 - Heated electrons to flow from hot to cold side of the TEG
 - Heat sinks increase cold side thermal dissipation
- Thermal sources may be human body, HVAC Air Flow, Machinery
 - Amount of energy generated based on TEG size and temperature gradient
 - 0.25 in² TEG generates ~100 μ W from finger touch (+5 Δ T °C)
- Applications
 - Fitness Bands and Smart Watches
 - Wearables/Tracking Beacons
 - Remote Sensing/Environmental Monitoring

acal | bfi

RF Harvesting

Regulatory considerations define available frequency bands and maximum output power

Harvested power available depends on sensitivity of receiver, efficiency of both harvester and energy storage

RF Harvesting

- For 2.4 GHz, not much energy ($<100\mu\text{W}$) available beyond 1m
- Sub GHz bands provide energy out past 2-3m

Theoretical Maximum Received Power vs. Distance

— 2440MHz @20dBm TX Power — 2440MHz @30dBm TX Power
— 915MHz @36dBm TX Power — 915MHz @30dBm TX Power

Sensor Hub

Sensor Hub

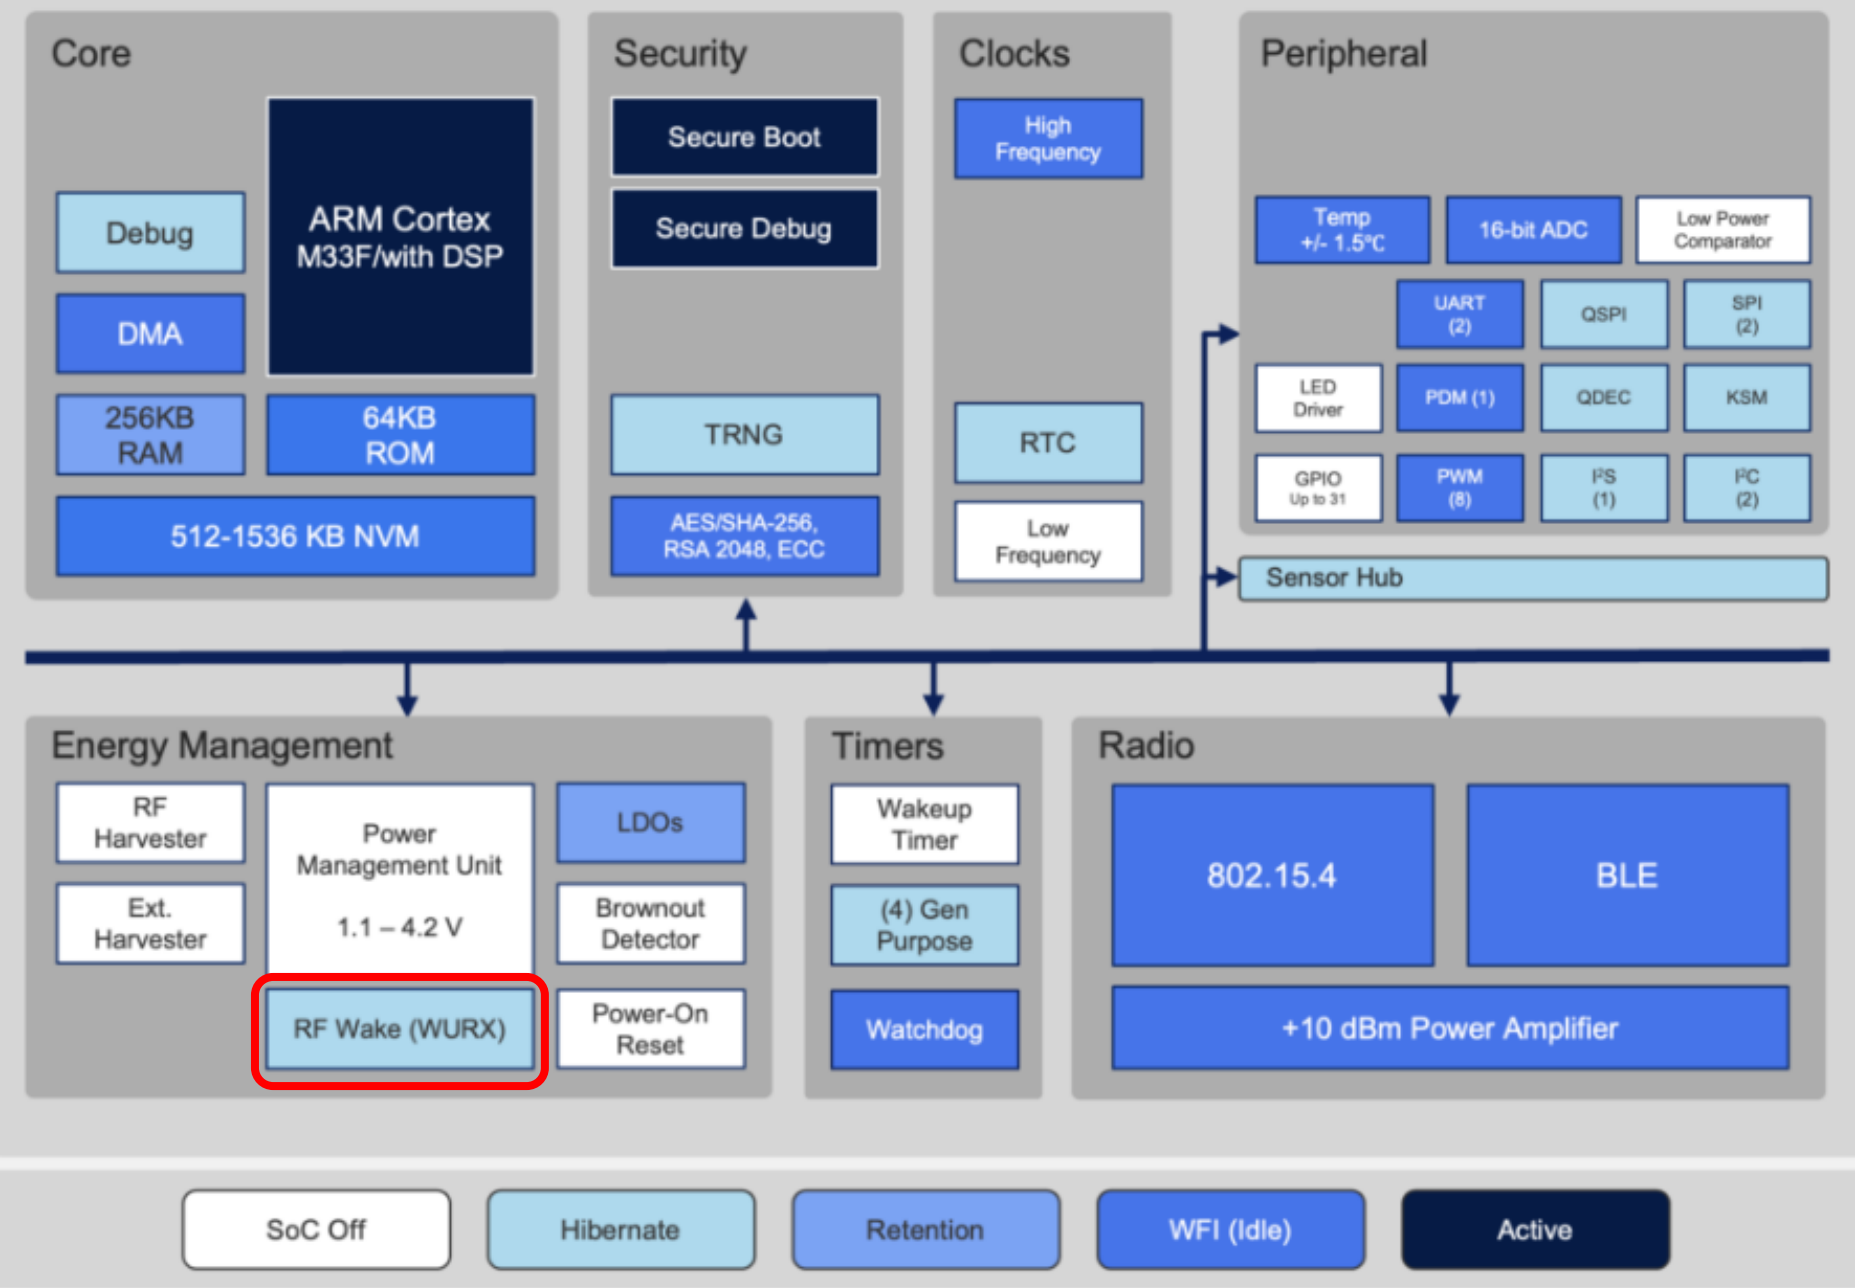

- Reduces overall power consumption for sensing applications
- Sensor Hub is operational during SoC Hibernation
 - Collects sensor data via SPI or I2C
 - Stores data directly to RAM/external Flash
- Sensor Hub can transmit the data without waking the MCU
 - Enables the Sensor Hub to send periodic Bluetooth LE advertisement with sensor data

Wake on RF

Wake on RF

- Facilitates on-demand or infrequent wakeup applications
- Separate wideband receiver enabled while chip is in hibernate
 - Input frequency 400 MHz to 2.5 GHz
 - Consumes only 300nA additional power
- Wakeup signal from mobile phone, tablet, gateway, or dedicated hardware
 - Use BT (inquiry), iBeacon, or non-BLE signaling
 - OOK detection in receiver
 - Individual device or group addressing supported
